MIT Professional Education

No Code and Agentic AI

14 Weeks | Designed by MIT Faculty | Live Mentorship by Industry Experts

No Code Approach | Generative AI, Responsible AI and, Agentic AI Modules Included | 10 CEUs

n8n
Curriculum Approved
Valid Until
December 17, 2026

Tools Covered

Open for Innovation KNIME | n8n | Google AI Studio | Gemini Notebook | Claude

THE MIT PROFESSIONAL EDUCATION EDGE

For over seven decades, MIT Professional Education has served as a gateway to MIT's research, knowledge, and faculty for professionals around the world. Its programs are designed to advance technical capability, leadership, and innovation by connecting practitioners with MIT's applied research and problem-solving approach. Guided by the Institute's mission to generate, disseminate, and preserve knowledge in service of industry and society, MIT Professional Education empowers learners to address today's most pressing challenges, through flexible, rigorous programs built for real-world application.

Built on MIT's Legacy of Innovation

Delivering advanced programs for professionals, MIT Professional Education brings the Institute's pioneering research and applied science directly to global learners, translating academic excellence into real-world impact.

World-Renowned Faculty

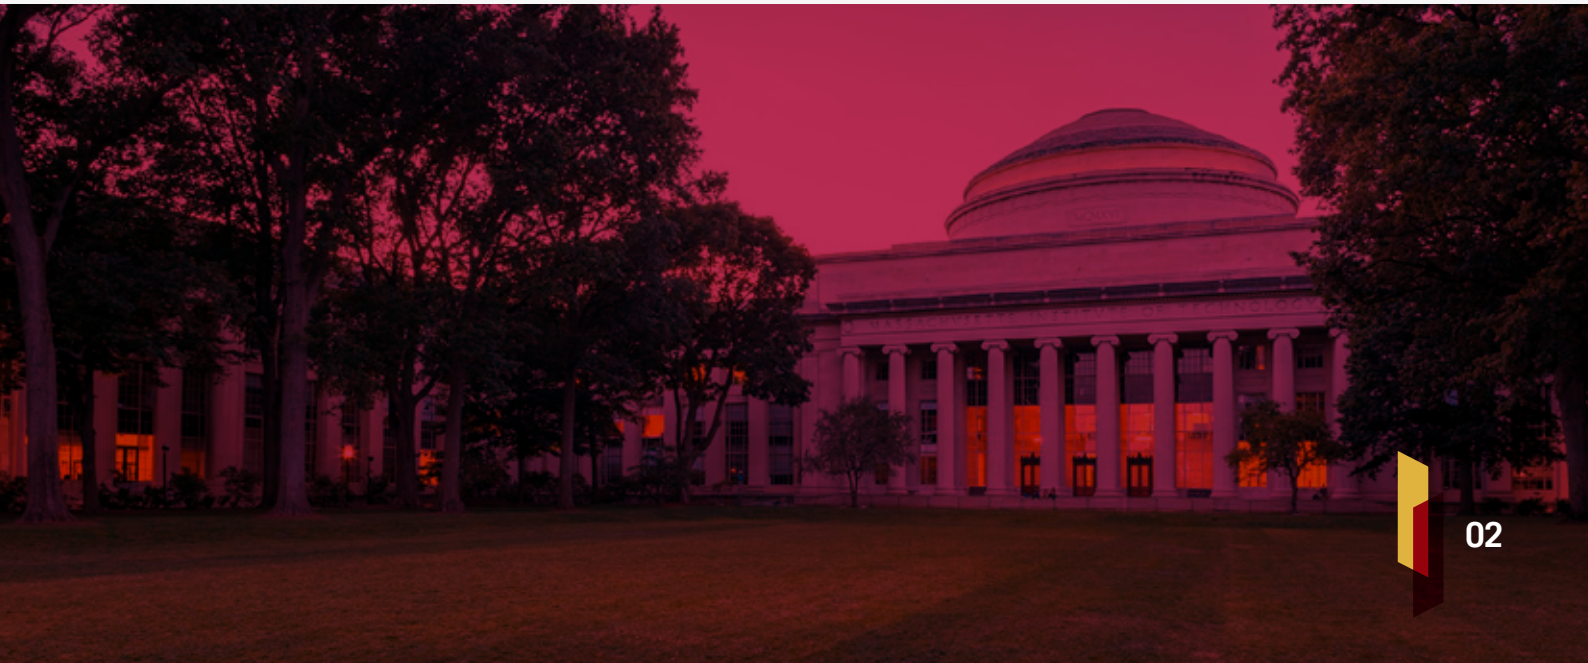

Programs are designed by MIT professors and senior instructors actively leading research in fields like Artificial Intelligence (AI), Machine Learning (ML), biotechnology, systems engineering, and innovation, reflecting the most current research emerging from MIT's labs and centers.

Ranked #1 Globally for AI and Data Science

MIT is ranked the #1 university in the world (QS World University Rankings 2026) in AI and Data Science and the #2 national university in the U.S. (U.S. News & World Report 2026). MIT Professional Education's programs reflect this leadership by integrating cutting-edge concepts and practical skill-building in these domains, enabling professionals to make data-driven decisions and lead digital transformation.

Recognized Credentials

Upon program completion, learners earn a globally recognized Certificate of Completion by MIT Professional Education, backed by MIT's rigorous standards and global reputation, and 10 CEUs representing 100+ hours of learning effort.

A Legacy of Empowering Leaders to Drive AI Innovation

MIT Professional Education's No Code and Agentic AI program is a recently upgraded version of the erstwhile No Code AI and Machine Learning program, which has enabled professionals to succeed in the data-driven era for over three years.

96%

Companies

Note: The above data is for the erstwhile No Code AI and Machine Learning program.

Design and Deploy AI Agents That Drive Business Impact Without Coding

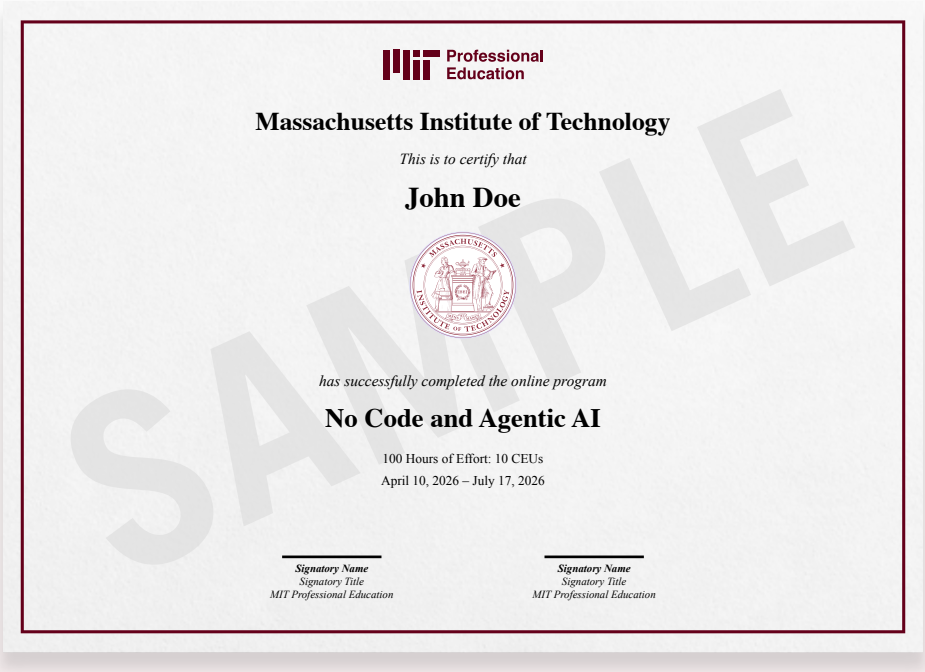

According to a 2025 survey by McKinsey & Company, nearly two-thirds of enterprises are experimenting with AI agents, yet fewer than 23% have scaled them to deliver measurable business value. Most organizations remain limited to isolated pilots, unable to translate experimentation into systems that address complex business problems.

The challenge is no longer confined to technical teams. Professionals across business functions are now expected to drive innovation and improve productivity using AI. This does not require coding expertise, but rather a holistic understanding of emerging AI technologies and the **strategic judgment** to apply them to core business objectives.

The 14-week **No Code and Agentic AI program** (previously called the No Code AI and Machine Learning program) by **MIT Professional Education** is designed for professionals without a technical background. It enables learners to design and implement AI-driven solutions without writing a single line of code.

With a **structured learning experience**, this program brings together **learning from experts** and **learning by doing**, critical to developing the intuition and strategic judgment needed to build and deploy AI at scale. Learners progress from core AI concepts to designing and deploying multi-agent systems using no code tools. They build AI agents, prototypes, and intelligent workflows that drive innovation and enhance productivity. By the end of the program, learners will have a portfolio of industry-relevant, hands-on projects that demonstrate their ability to solve business problems using AI and deliver measurable outcomes.

Certificate Of Completion

Note: The image is for illustrative purposes only. The actual certificate may be subject to change at the discretion of MIT Professional Education.

Program Benefits

Learn from MIT Faculty
Experience 20 hours of recorded video lectures from award-winning MIT professors, allowing you to learn from world-class experts at your convenience, wherever you are.

Live Mentorship by Industry Experts
Access 14+ live mentorship sessions (2 hours each) led by industry experts, focused on building practical skills and applying them in real-world contexts.

Demonstrate Your Skills with Hands-On Projects
Build a portfolio featuring 3 industry-relevant projects and 14+ case studies to showcase your practical AI capabilities.

Earn Recognized Credentials
Upon successful completion, you will receive a Certificate of Completion from MIT Professional Education and earn 10 Continuing Education Units (CEUs).

Hands-On Labs & Tools
Access to OpenAI API keys and n8n lab (both provided by Great Learning) to build, test, and deploy AI workflows in a practical setting.

Special Feature
Build expertise beyond the core curriculum with additional self-paced modules by industry experts on Anthropic.

"I joined the program with an interest in the AI and ML field with no previous knowledge. The program gave me a complete overview and understanding of the field and methodologies. The reliance on projects either as case studies during weekly sessions or as individual assignments is a real plus."

RUBBENS PARCHET
Program Manager Sustainability,
Philip Morris International

Why No Code?

In today's fast-evolving AI landscape, the power to experiment, prototype, and implement intelligent solutions is no longer limited to technical experts. No code platforms are democratizing AI by enabling business and functional leaders to harness advanced Agentic AI, Generative AI, and ML without any coding expertise.

The Strategic Advantage

Accelerate Innovation
Eliminate the coding barrier and enable the independent deployment of AI solutions.

Enable Rapid Prototyping
Rapidly build, test, prototype, and iterate AI solutions, without traditional development bottlenecks.

Bridge the Strategy–Execution Gap
Empower domain experts to experiment with AI directly, reducing gaps and improving ROI.

Lower Costs and Risks
Validate ideas quickly before large investments, avoiding expensive development cycles.

Tap into Agentic AI
Leverage Agentic AI to create intelligent systems that autonomously plan, decide, and act.

No Code AI Landscape

Agentic AI
Design autonomous workflows that handle complex, multi-step tasks such as contract analysis, employee onboarding, or customer query resolution.

Generative AI
Automatically generate reports, marketing content, emails or summaries using enterprise data for consistent, high-quality outputs.

Machine Learning
Predict customer churn, forecast demand, segment customers, and optimize logistics with no code ML tools.

Who Is This Program For?

Business analysts, product managers, and professionals in tech-adjacent roles looking to create rapid AI prototypes and build intelligent workflows.

Functional managers across **marketing, operations, legal,** and **finance** looking to understand practical AI applications and design intelligent workflows to boost productivity.

Business leaders and functional heads seeking to lead AI initiatives and guide their teams.

Entrepreneurs and independent consultants aiming to innovate, build practical AI solutions and drive growth.

After This Program You Will Be Able To:

Speak the Language of AI
Develop a working understanding of AI, from classical machine learning to autonomous agents, to make informed decisions and engage in meaningful conversations.

Build Without Writing Code
Design, run, and test AI workflows using intuitive no code tools for rapid experimentation and deployment.

Work Intelligently with LLMs
Understand large language models and apply Prompt Engineering to produce reliable outputs and build Generative AI workflows for business automation.

Turn Data into Decisions
Apply clustering, classification, and regression with no code tools to uncover patterns, predict outcomes, and support data-driven decisions.

Build AI That Knows What It Does Not Know
Develop Retrieval-Augmented Generation (RAG) pipelines that connect models to trusted data sources, improving accuracy and reducing hallucinations.

Design and Deploy AI Agents
Build autonomous agents that can plan, use tools, retain memory, and execute complex multi-step tasks.

Orchestrate Multi-Agent Systems
Design systems where multiple AI agents collaborate to handle complex tasks, with methods to measure and improve performance.

Evaluate AI Before You Trust It
Use structured evaluation methods to assess the accuracy, reliability, and quality of AI outputs before deployment.

STRUCTURED LEARNING IN THE AGE OF AI

Today, the technical knowledge barriers to learning and using AI have diminished greatly. However, barriers of a different kind that impact its successful implementation have emerged; those involving **human intuition and strategic judgment.** To consistently get the best from any AI tool and drive business impact, one must understand the fundamentals of the underlying technology.

Our structured approach combines **learning from experts** who have created the curriculum and **learning by doing** through hands-on work using the latest tools and technologies. Together, these ensure a well-rounded learning experience. **The university credential** provides formal validation of your expertise, a valuable differentiator in a world where everyone claims to be proficient in AI.

A STRUCTURED LEARNING APPROACH TO BUILDING REAL-WORLD AI CAPABILITY

LEARN FROM EXPERTS

Build a strong foundation and the judgment needed to critically evaluate AI outputs as tools evolve.

- Structured curriculum designed by leading MIT faculty
- Recorded video lectures from award-winning MIT faculty
- Live mentorship sessions with industry experts

LEARN BY DOING

Build a portfolio of real-world projects that demonstrates expertise in the latest tools and technologies.

- 3 hands-on projects
- 14+ case studies
- Tools and technologies

EARN A UNIVERSITY CREDENTIAL

Get recognized by a renowned university that formally validates your expertise through rigorous assessments.

- MIT is ranked #2 national university in the U.S.
- Certificate of Completion from MIT Professional Education
- 10 Continuing Education Units (CEUs)

Program Faculty

Stefanie Jegelka is an Associate Professor in the Department of Electrical Engineering and Computer Science at MIT. She is affiliated with the Computer Science and Artificial Intelligence Laboratory (CSAIL), the Institute for Data, Systems, and Society (IDSS), and MIT's Machine Learning group. Her research spans algorithms, optimization, and Machine Learning, with a focus on combinatorial and discrete problems in modern AI systems. Prior to joining MIT, she was a postdoctoral researcher at the AMPlab and the Computer Vision Group at the University of California, Berkeley. She earned her Ph.D. at the Max Planck Institute in Tübingen and ETH Zurich. Jegelka is recognized for her innovative contributions to the theoretical foundations of Machine Learning.

Dr. Caroline Uhler is an Associate Professor at MIT, affiliated with multiple research departments including the MIT Institute for Data, Systems, and Society (MIT IDSS), MIT Laboratory for Information and Decision Systems (MIT LIDS), MIT Statistics and Data Science Center, and the MIT Operations Research Center (MIT ORC). Dr. Uhler holds an MSc in mathematics, a BSc in biology, an MEd in mathematics education from the University of Zurich, and a Ph.D. in statistics from UC Berkeley. Her career includes a tenure as a research fellow at the Simons Institute's Big Data program, postdoctoral roles at the Institute for Mathematics and its Applications and ETH Zurich, and an assistant professorship at IST Austria. Dr. Uhler is a distinguished member of the International Statistical Institute and recipient of numerous accolades including the Simons Investigator Award, Sloan Research Fellowship, and NSF Career Award. Her research centers on mathematical statistics, particularly graphical models and causal inference, with practical applications in biology and genomics.

Note: The above list is indicative and subject to change.

John Tsitsiklis is the Clarence J. Lebel Professor in the Department of Electrical Engineering and Computer Science at MIT and is affiliated with the Laboratory for Information and Decision Systems (LIDS). His research spans systems, optimization, control, and operations research. He has held several leadership roles at MIT, including Director of LIDS (2017–2020) and co-director of the Operations Research Center (2002–2005). He has also contributed to national research efforts in Greece, serving on the National Council on Research and Technology and chairing the Council of Harokopio University. Tsitsiklis is the co-author of several influential books, including Parallel and Distributed Computation, Neuro-Dynamic Programming, Introduction to Linear Optimization, and Introduction to Probability. He is a member of the National Academy of Engineering and a Fellow of IEEE and INFORMS. His awards include the ACM Sigmetrics Achievement Award, the INFORMS John von Neumann Theory Prize, and the IEEE Control Systems Award. He holds honorary doctorates from the Université Catholique de Louvain, Athens University of Economics and Business, and Harokopio University. He earned his B.S. in Mathematics and his M.S. and Ph.D. in Electrical Engineering, all from MIT.

Munther Dahleh is a prominent figure in the MIT academic community, holding the position of William A. Coolidge Professor. He was the founding director of the Institute for Data, Systems, and Society (IDSS), serving from July 1, 2015, to June 30, 2023. He is also a member of the MIT Laboratory for Information and Decision Systems (LIDS). Dahleh began his academic journey at MIT in 1987 as an assistant professor and was promoted to full professor in 1998. His research spans robust control theory, computational controller design, the relationship between information and control, and systemic risk in interconnected systems. He is internationally recognized for his contributions to these domains and has served as a visiting professor at Caltech and a consultant to several organizations worldwide.

Devavrat Shah is the Andrew (1956) and Erna Viterbi Professor in the Department of Electrical Engineering and Computer Science at MIT. He is also affiliated with the Laboratory for Information and Decision Systems (LIDS), the Institute for Data, Systems, and Society (IDSS), and the Operations Research Center (ORC). He earned his Ph.D. in Computer Science from Stanford University. His research focuses on large-scale networks and inference, including stochastic networks, network algorithms, and network information theory. Over the years, Shah has received several prestigious accolades, such as the President of India Gold Medal, the INFORMS George B. Dantzig Best Dissertation Award, the ACM SIGMETRICS Rising Star Award, and the Erlang Prize from INFORMS. He was also honored as a Distinguished Young Alumnus by IIT Bombay. He co-founded Celect, Inc., which was acquired by Nike in 2019, and later co-founded Ikigai Labs to support data-driven decision-making in businesses.

Note: The above list is indicative and subject to change.

Program Structure

The structured learning pathway includes recorded lectures from MIT faculty, live mentorship from industry experts, and hands-on practice to help learners build practical skills and achieve measurable outcomes.

PROGRAM BREAKDOWN	
WEEK 0	Pre-Work: AI Foundations + No-Code Tool Setup and Onboarding
WEEKS 1-2	AI, Gen AI and Agentic AI Landscape; LLMs and Prompt Engineering
WEEKS 3-6	Data Exploration; Prediction Methods — Regression and Decision Systems; and Recommendation Systems
WEEK 7	Project Week
WEEK 8	Learning Break
WEEKS 9-10	Build Workflows on Proprietary Data and Business Context; Evaluating Generative AI Workflows
WEEK 11	Project Week
WEEKS 12-13	Single-Agent Systems; Build Autonomous Systems Using Multi-Agent Architectures
WEEK 14	Project Week
SELF-PACED	Claude-Based AI Workflows, Deep Learning and Neural Networks, Computer Vision Methods, Ethical and Responsible AI, Data Exploration: Temporal Data

"The assessment truly tested our understanding of the subject and foundational concepts, while the project helped us gain hands-on experience. One of my key learnings was understanding how recommendation engines are built for e-commerce platforms, and how classification models can be applied to manage fraud in payment systems."

SASIKANTH NAGALLA
Payments Risk Data Science,
Stripe (US)

Program Curriculum

Pre-Work: AI Foundations, No Code Tools Setup and Onboarding

Establish a foundational understanding of data-driven decision-making and gain hands-on experience with no code tools before the program begins.

- Origins of data-driven decision-making
- Paradigms of Data Science and AI
- Role of mathematics and statistics in AI/DS
- Environment setup for KNIME and n8n
- Navigating interfaces and core functionalities
- Building and executing your first AI workflow

Week 1: AI, GenAI, and Agentic AI Landscape

Understand the full arc of AI evolution and contextualize where Generative and Agentic AI fit within the broader landscape.

- AI evolution & architectural shifts: rule-based systems → ML → deep learning → transformers Generative AI→agentic systems
- Key architectural breakthroughs driving each transition
- The evolution and challenges of data operations
- Use cases and practical applications of data operations

Week 2: LLMs and Prompt Engineering

Understand how Large Language Models (LLMs) work and apply Prompt Engineering techniques to produce reliable, high-quality outputs.

- Evolution of generative models
- Mechanics of diffusion models and LLMs
- Challenges, hallucinations, and alignment
- Common use cases: chatbots, content generation, summarization
- Impact on decision-making: speed, scalability, limitations
- Training process of foundation models and in-context learning
- Prompt Engineering techniques for improving output quality and consistency

Week 3: Data Exploration

Apply clustering and dimensionality reduction techniques to segment data and extract meaningful patterns.

- K-means clustering
- K-medoids clustering
- Gaussian mixture models (GMM)
- Applying clustering for data segmentation and pattern extraction
- Principal component analysis (PCA)
- t-SNE for visualization
- Transforming high-dimensional data into interpretable representations

Week 4: Prediction Methods — Regression

Build and evaluate regression models using no code tools to predict numerical outcomes and identify key drivers.

- Fundamentals of supervised learning
- Linear regression for predicting numerical outcomes
- Interpreting model outputs to identify key drivers
- Using KNIME for regression workflows
- Testing basic statistical assumptions
- Applying performance metrics for model evaluation

Week 5: Prediction Methods — Decision Systems

Apply classification techniques and ensemble methods to real-world categorization problems, including text classification using LLMs.

- Fundamentals of classification in supervised learning
- Decision trees for categorization and prediction tasks
- Classification performance metrics
- Improving performance using ensemble methods
- Random forest for enhanced classification
- Using LLMs for text classification tasks
- Enhancing classification with Generative AI techniques

Week 6: Recommendation Systems

Build and apply recommendation systems using rank-based, content-based, and collaborative filtering approaches.

- Common recommendation patterns in everyday applications
- How recommenders drive user experience
- Rank-based recommendation methods
- Content-based filtering
- Collaborative filtering approaches
- Applying recommendation techniques to real-world data

Week 7: Project Week

Week 8: Learning Break

Scheduled break for consolidation and review

"The program is excellent, with high-quality, easy-to-follow material. The extensive resources provided and excellent follow-up from tutors and teachers make learning accessible and comprehensive. I highly recommend this program."

LUZ ELENA NARVAEZ HERNÁNDEZ
Secretary of Aerospace Planning and Innovation,
Universidad Aeronáutica en Querétaro (Mexico)

Week 9: Build Workflows on Proprietary Data and Business Context

Build and evaluate RAG pipelines that connect LLMs to external knowledge sources for more reliable, grounded outputs.

- Attention mechanism fundamentals
- Variants: masking techniques and multi-head attention
- Role of positional encoding in sequence understanding
- Vision transformers (ViT) for image-based tasks
- Role of external knowledge sources in improving accuracy and reliability
- Data chunking techniques
- Embeddings for representing unstructured data
- Building RAG pipelines
- Evaluating RAG for accuracy and performance improvements

Week 10: Evaluating Generative AI Workflows

Apply structured evaluation methods to assess Generative AI outputs and optimize prompts for reliability and accuracy.

- Metrics for text evaluation: ROUGE, BERTScore
- LLM-as-a-judge for objective assessment
- Identifying hallucinations through consistency checks
- Prompt optimization techniques for better accuracy and reliability

Week 11: Project Week

Week 12: Single Agent Systems

Design and deploy single AI agents that can plan, remember, use tools, and complete multi-step business tasks autonomously.

- Agent-environment interaction framework
- Core elements: states, actions, rewards, policy
- Q-learning: value-based learning for decision-making
- Policy gradient methods: direct policy optimization
- Transition from reactive LLMs to autonomous agents
- Key characteristics and use cases of AI agents
- Memory, planning, and tool usage in agent architectures
- Designing task-oriented agent workflows
- Applying agents to solve specific business problems

Week 13: Build Autonomous Systems Using Multi-Agents

Design and evaluate multi-agent systems where agents collaborate, hand off tasks, and handle real-world complexity.

- Designing collaborative agent systems
- Dynamic task routing across agents
- Handling uncertainty and errors in agent workflows
- Constructing workflows using multi-agent collaboration
- Applying adaptive RAG in generative AI systems
- Defining evaluation metrics (e.g., tool accuracy)
- Measuring the effectiveness of agent-based systems

Week 14: Project Week

Note: Weeks are indicative and subject to vary as per holiday schedule for the cohort

Self-Paced Modules

Claude-Based AI Workflows

Build practical capability in applying Generative AI and Agentic AI using the Claude ecosystem in real-world contexts. Design, execute, and evaluate AI-driven workflows for real-world applications, supported by ~5 hours of structured learning.

Design and Execute AI Workflows

- Model selection and prompt engineering using **Claude Chat**
- Agentic workflow design and orchestration using **Claude CoWork**
- Plan → Approve → Execute → Iterate framework
- Design workflows with reasoning, tools, and multi-step execution
- Apply concepts through real-world case studies

**Disclaimer: Claude API access is not included as part of the program. Learners may explore advanced usage independently.*

Deep Learning and Neural Networks

Learn the fundamentals of deep learning, including the building blocks of neural networks, their structure, and how they learn from data. Explore key concepts such as layers, activation functions, and training processes, and apply them to practical tasks like digit recognition. Build a foundational understanding of how neural networks are designed, trained, and used in real-world AI applications.

Computer Vision Methods

Explore how AI systems interpret and analyze visual data, starting with the limitations of traditional neural networks in image-based tasks. Understand the building blocks of convolutional neural networks and how they are designed to capture spatial patterns and features in images. Examine how these models are trained and optimized, and apply them to practical use cases such as image detection. Build a clear understanding of how modern computer vision systems are designed and used in real-world scenarios.

Ethical and Responsible AI

Understand the principles of building AI systems that are ethical, transparent, and accountable. Explore the AI lifecycle and examine how bias can arise at different stages, along with real-world examples. Cover key concepts such as causality, privacy, and broader interconnections across domains that influence AI outcomes. Develop the ability to critically evaluate and design AI solutions that are responsible and trustworthy by understanding interdependencies and feedback loops within AI systems.

Data Exploration: Temporal Data

Understand time series as a unique data modality that requires specialized techniques for analysis. Explore the key components of time series data, including trend, seasonality, and noise, and how to identify and estimate these patterns. Cover foundational methods for time series forecasting, enabling analysis of temporal data and generation of informed predictions for real-world applications.

Note: Weeks are indicative and subject to vary as per the holiday schedule for the cohort

Sample Hands-On Projects

HOSPITALITY

Automated Booking Cancellation Prediction to Optimize Revenue
Predict which hotel bookings are likely to be cancelled to reduce revenue loss and support the design of more effective cancellation policies for a hotel group.

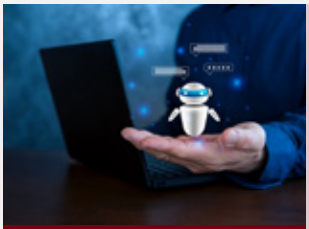

Key Skills You Will Learn: Clustering, Classification, Regression, KNIME Workflows, Model Evaluation

FINANCE

Financial Report Analyzer
Help financial analysts extract key information from lengthy annual reports to improve decision-making efficiency.

Key Skills You Will Learn: RAG Pipelines, Embeddings, Data Chunking, LLM Integration

CUSTOMER SUPPORT

AI Helpdesk — Agentic Customer Support System
Improve support efficiency by implementing an agentic AI system that classifies tickets, retrieves knowledge, generates policy-compliant responses, and handles escalation.

Key Skills You Will Learn: AI Agents, RAG, Multi-Agent Design, Tool Usage, Output Evaluation

Sample Case Studies

RETAIL — AI-Powered Chatbot to Handle Retail Order Queries

Understand how an AI-powered chatbot enables dynamic, context-aware interactions to assist with product queries and order tracking, improving the overall shopping experience.

Key Skills You Will Learn: Prompt Engineering, LLMs, AI Agents

HEALTHCARE — Product Feasibility Intelligence

Analyze the feasibility of a new medical device by reviewing process documentation, comparing against client requirements, and generating a structured feasibility assessment.

Key Skills You Will Learn: Document Analysis, LLMs, RAG

PUBLIC POLICY — Global Socio-Economic Segmentation

Analyze country-level socio-economic data to segment nations into meaningful development groups such as underdeveloped, developing, and developed economies.

Key Skills You Will Learn: EDA, K-Means Clustering, K-Medoids Clustering

MEDIA & ENTERTAINMENT — Streaming Viewership Analysis

Analyze key drivers of first-day content viewership to support data-driven improvements in marketing, scheduling, and release strategies.

Key Skills You Will Learn: EDA, Linear Regression

CONSUMER TECH — Product Sentiment Intelligence

Analyze large volumes of smartwatch reviews across social and retail platforms to quantify overall sentiment and identify key product pain points.

Key Skills You Will Learn: Sentiment Analysis, Aspect-Based Analysis, LLMs

E-COMMERCE — E-Commerce Recommendation Engine

Generate personalized recommendations by combining purchase history, cart data, and real-time clicks to improve conversion rates.

Key Skills You Will Learn: Collaborative Filtering, Content-Based Filtering

INSURANCE — Health Insurance Assistant

Build a RAG-based chatbot that delivers accurate, context-aware responses to health insurance policy queries using external knowledge sources.

Key Skills You Will Learn: RAG, Knowledge Retrieval, LLMs

FINANCE — Investment Advisory Assistant

Improve the reliability of an AI assistant handling investment and compliance data through consistency checks and prompt optimization within a RAG pipeline.

Key Skills You Will Learn: RAG, Consistency Checks, Prompt Optimization

SUPPLY CHAIN — Autonomous Inventory Replenishment Agent

Develop an AI agent that monitors stock levels, forecasts demand, identifies optimal suppliers, and automates purchase order creation to streamline inventory replenishment.

Key Skills You Will Learn: AI Agents, Demand Forecasting, Agentic Workflows

LEGAL — Regulatory Intelligence Assistant

Build an AI-powered assistant that retrieves regulatory data, synthesizes insights from multiple sources, and generates structured compliance summaries.

Key Skills You Will Learn: Agentic Workflow, RAG, LLM-Based Evaluation

Program Mentors

The program features mentorship from Data and Machine Learning experts through live and personalized mentored learning sessions. Mentors will guide you in applying concepts to various industry case studies and projects to enable you to build real-world skills.

Cristiano Santos de Aguiar
Lead Data Scientist

Jatin Dawar
Senior Machine Learning Engineer

Olabode James
Machine Learning Architect

Peyman Hessari
Sr. Data Scientist

Note: The above list is indicative and subject to change.

Program Support

The Program Support Team will assist you throughout your learning journey, acting as your single point of contact for all non-academic support, monitoring progress, and ensuring you receive timely help and encouragement.

"This is a place where you can learn not only about what AI really offers you, but also how to construct solutions without having coding experience."

Munther Dahleh

Founding Director, MIT Institute for Data, Systems and Society (IDSS), William A.Coolidge Professor, Electrical Engineering & Computer Science

Application Process

STEP 1

Application Form
Register by completing the online application form.

STEP 2

Application Screening
A panel from Great Learning will review your application to determine your fit for the program.

STEP 3

Join the Program
After a final review, you will receive an offer for a seat in the upcoming cohort of the program.

Program And Fee Details

Duration 14 Weeks

Fee USD 2,850

Prerequisites
High-school-level understanding of statistics and mathematics. No prior coding knowledge is required.

Completion Requirements
Minimum 60 percent score in each individual module.

About MIT Professional Education

For more than 75 years, MIT Professional Education has been providing technical professionals worldwide a gateway to renowned MIT research, knowledge, and expertise, through advanced education programs designed specifically for them. In addition to industry-focused, two-to-five day live online and on-campus courses through Short Programs, MIT Professional Education offers professionals the opportunity to take online and blended learning courses through Digital Plus Programs, attend courses abroad through International Programs, enroll in regular MIT academic courses through the Advanced Study Program, or attend Corporate Programs designed specifically for their companies. For more information, please visit *professional.mit.edu.*

In Collaboration With

Great Learning

MIT Professional Education is collaborating with online education provider Great Learning to offer the No Code and Agentic AI program. The program leverages MIT's leadership in innovation, science, engineering, and technical disciplines developed over years of research, teaching, and practice. Great Learning collaborates with institutions to manage enrollments (including all payment services and invoicing), technology, and learner support.
